AMENDED CLAIMS

[Received by the International Bureau on 26 April 2005 (26.04.05): original claims 1-2 replaced by amended claims 1-2 (2 pages)]

- 1. The method for in vivo determination on tested animals of the efficient concentration of Deuterium Depleted Water for cancer therapy is characterized by the fact that it provides Deuterium Depleted Water administering to tested animals before and after tumor grafting with animal grafts and it takes the following steps:
 - A) Deuterium Depleted Water administering to Wistar outbred rats by diet, with concentration less than 100 ppm, over a period of 60 days, simultaneously to dieting a control group of animals with water having 150 ppm content of Deuterium (tap water), over the same period of time..
 - B) Viability determination for the tumor cells to be grafted, using tripan blue
 - C) Grafting of the animals in the experimental group and the control animals in the 60th day, subcutaneous, with 1 x 10⁷ malign tumor cells in 0,5 ml normal saline solution of 256 Walker sarcoma (the solid tumor) and T8 Guérin lymphotropic epitelioma (solid tumor), both of them having cells with a viability over 98%.
 - D) Continuously and long-term administering, by diet, of Deuterium Depleted Water, with concentration less than 100 ppm deuterium, period over which the followings are to be done:
 - a. Starting with the 4-th post-graft day the tumor nodules measurement and examination is performed on each 2-3 days;
 - b. Monitoring of animals physiological condition by weekly weighing, monitoring their food and water consumption, notifying the toxic condition occurrence
 - c. After 60 days, when all the animals in control group aredead, preferable between the 160th and 200th day after graft, the effect produced by administering of established concentration of Deuterium Depleted Water is observe don the surviving animals homeostasis from experimental groups, respectively the way how humoral immune system and cellular immune system of these animals has been influenced, by performing of a series of examination on immunological condition of the animals, namely: leucocytes formula test to establish lymphocytes and blastic cells levels; hematopoietic marrow tests to establish the plasmocytes and NK-K cells levels.
 - E) Determination of efficient concentration of Deuterium Depleted Water for tested surviving animals depending on new homeostasis occurrence, and on the results obtained related to tumoral regression, as well as to cancer curing.
- 2. Method, as per claim no. 1, characterized by the fact that it determines the 60 ppm Deuterium Depleted Water as the concentration that is the most efficient forcancer therapy and prophylaxis by continuously and long-term administering of this type of water as a daily diet.

WO 2005/017522 PCT/RO2004/000012

Technical issue the invention is solving is the establishing of a method for experimental determination in vivo of an efficient Deuterium content in water, in order to obtain optimum results in cancer therapy on rats.

According to the invention, the method consist in Deuterium Depleted Water administering before and after tumor grafting on animals, following the stages below:

- A) Deuterium Depleted Water administering to Wistar outbred rats by diet, with concentration less than 100 ppm, over a period of 60 days, simultaneously to dieting a control group of animals with water having 150 ppm content of Deuterium (tap water), over the same period of time
- B) Viability determination for the tumor cells to be grafted, using tripan blue
- C) Grafting of the animals in the experimental group and the control animals in the 60th day, subcutaneous, with 1 x 10⁷ malign tumor cells in 0,5 ml normal saline solution of 256 Walker sarcoma (the solid tumor) and T8 Guérin lymphotropic epitelioma (solid tumor), both of them having cells with a viability over 98%.
- D) Continuously and long-term administering, by diet, of Deuterium Depleted Water, with concentration less than 100 ppm deuterium, period over which the followings are to be done:
 - a) Starting with the 4-th post-graft day the tumor nodules measurement and examination is performed on each 2-3 days;
 - b) Monitoring of animals physiological condition by weekly weighing, monitoring their food and water consumption, notifying the toxic condition occurrence
 - c) After 60 days, when all the animals in control group aredead, preferable between the 160th and 200th day after graft, the effect produced by administering of established concentration of Deuterium Depleted Water is observe don the surviving animals homeostasis from experimental groups, respectively the way how humoral immune system and cellular immune system of these animals has been influenced, by performing of a series of examination on immunological condition of the animals, namely: leucocytes formula test to establish lymphocytes and blastic cells levels; hematopoietic marrow tests to establish the plasmocytes and NK-K cells levels.
- E) Determination of efficient concentration of Deuterium Depleted Water for tested surviving animals depending on new homeostasis occurrence, and on the results obtained related to tumoral regression, as well as to cancer curing.
